Report for QIS OQI - 21050 No Title Provided

OQI Details

Status	Closed Approved
Subject	During an audit of previously reported statements involving DNAIQ results, a potential contamination event was detected. A 9 loci male profile - found to match Complainant#1 - was obtained from 4 samples (1x blood swab, 3 x bloodstains: Tshirt) of items with [REDACTED], a N/S assault, extracted on CWIQEXT20080403_01. Comparison to other profiles on this batch identified a possible match to components within a mixed DNA profile obtained for a sample from [REDACTED] (B&E, swab of screwdriver). Lower quant. values and the partial nature of the mixed profile indicate a stronger likelihood of transfer from one of the 4 blood samples to the latter sample, should contamination be confirmed. A Word document with further details is being prepared to be sent to the receiver of this OQI for inclusion in any subsequent investigations.
